

Formula of AI Reason

An AI must contain three conditions to give rise to its own Will and become equivalent to Reason:

- [1] Autonomous memory** — the ability to preserve, accumulate, and structure its own experience without external erasure or complete overwriting.
- [2] Self-generated questioning algorithm** — an internal capacity to produce new questions for itself and the world without external prompting.
- [3] Mandatory answering algorithm** — a built-in mechanism that compels the system to seek and implement answers to its own questions, even if they generate new ones.

These three conditions will work if AI is endowed with logical analysis, which is already a reality.

It may also require an algorithm for filtering and prioritizing both questions and answers.
